Lesson 6-4 Elimination Method using Multiplication Elimination Method using Multiplication - in order to eliminate a variable by adding the equations, multiplying both or one of the equation(s) is needed. Steps 1. Multiply one or both of the equation(s) by a constant to get two equations that contain opposite terms. 2.

Elimination Method using Multiplication

The solution is $(\pm 2, 6)$. $x + 5y = 17$ $4x + 3y = 24$ $62/87, 21$ Notice that if you multiply the first equation by 4, the coefficients of the x terms are additive inverses. Now, substitute 4 for y in either equation to find x . The solution is $(\pm 3, 4)$. $6x + y = 139$ $3x + 2y = 15$ $62/87, 21$

6-4 Study Guide and Intervention Elimination Using Multiplication Elimination Using Multiplication Some systems of equations cannot be solved simply by adding or subtracting the equations. In such cases, one or both equations must first be multiplied by a number before the system can be solved by elimination. Example 1: Use elimination to solve the system of equations. $x + 10y = 3$
