Lime has been used as a means of sweetening acid soils for many years, and may be the reason that in areas of acid soils agricultural land is less affected by acid rain than the natural environment. In areas where natural regeneration is no longer possible, the restoration of the original chemical balance of the soil by liming and appropriate fertilizer application might allow reforestation to be successful.

Solutions To The Problem Of Acid Rain - Environmental Issues

Acid rain occurs when these gases react in the atmosphere with water, oxygen, and other chemicals to form various acidic compounds. Sunlight increases the rate of most of these reactions. The result is a mild solution of sulfuric acid and nitric acid. How Do We Measure Acid Rain? Acid rain is measured using a scale called "pH."

Acid rain forms when these chemical pollutants react with the oxygen and water vapor in the air to form nitric acid and sulfuric acid. These acids can combine with precipitation directly over their source. But more often than not, they follow the prevailing winds and blow hundreds of miles away before they return to the surface via acid rain.

Acid Rain: What Is It and How Can You Prevent It?

Acid rain, precipitation possessing a pH of about 5.2 or below mainly produced from the emission of sulfur dioxide (SO₂) and nitrogen oxides (the combination of NO and NO₂).
